

Positive Pneumatic System

*Discover
REYCO Quality*

The REYCO Positive Pneumatic System isn't just another waste-handling tool — it reflects years of engineering refinement, industry feedback, and reliable performance across diverse food plants. Designed to replace traditional water flumes, conveyors, and lift-trucks, it uses blower-pressurized piping, rotary airlocks, and fully enclosed lines to move peelings, culls, trim, and other solid waste cleanly and efficiently.

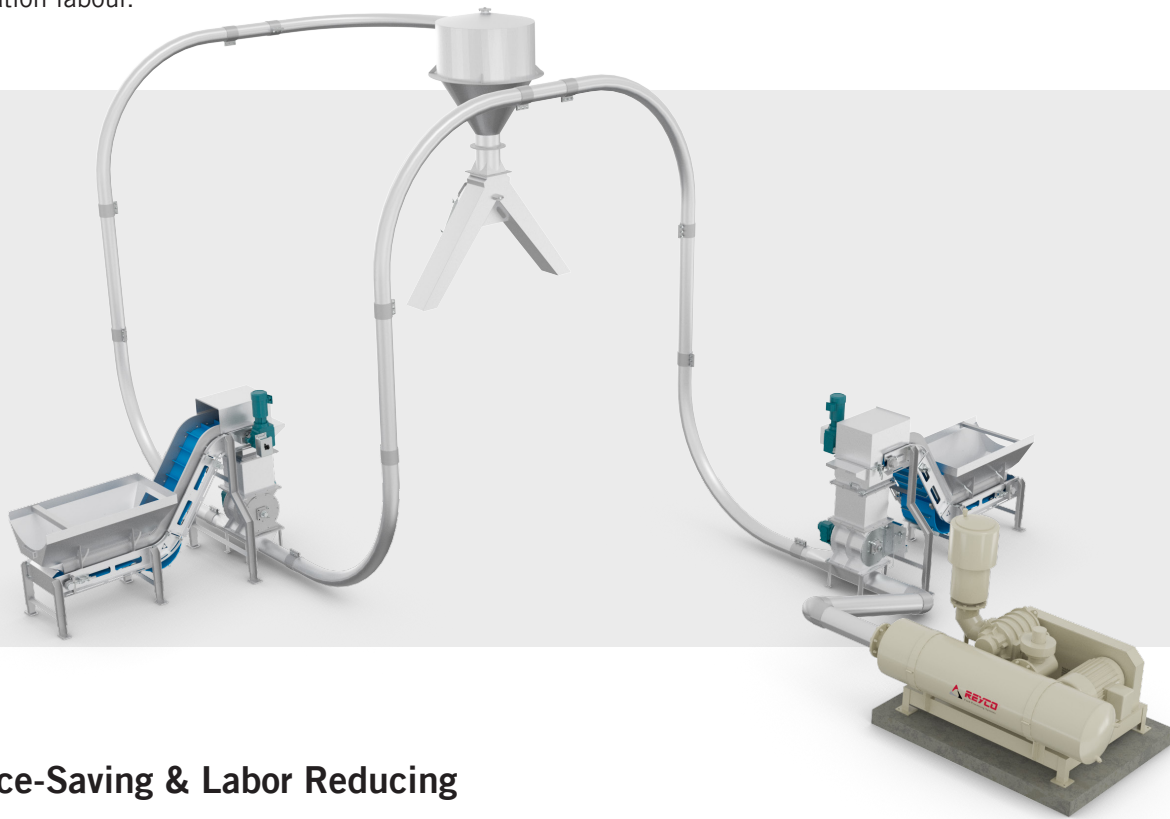

This system is made to endure. All stainless or food-grade steel components, durable blower packages, and thoroughly tested rotary airlocks ensure minimal wear. Many REYCO Positive Pneumatic Systems installed years ago are still operating today — proof of build quality and continuous improvement.

What's more, REYCO designs these systems for flexibility: pipelines can run under cutting decks, through foundations, overhead, or along roofs to fit any plant layout. You get a cleaner facility with fewer touch points, less manual handling, and significantly lower sanitation overhead. When waste has to move, do it safely, quietly, and with minimal fuss — that's REYCO quality in action.

Clean and Safe Waste Transport

The Positive Pneumatic System pressurizes waste piping routed under cutting decks, inside foundations, or overhead. Waste is metered in via rotary airlocks and then quickly transferred to a bin or waste truck. This fully enclosed path minimizes exposure, cross-contamination, and sanitation labour.

Cleaner lines. Safer operations.

Space-Saving & Labor Reducing

Replace bulky conveyors, belt systems, or flumes with pipework that tucks out of the way. Without conveyors or lift trucks, you save on equipment maintenance, staff time, and facility layout constraints. Ideal for plants needing tighter workflows and fewer moving parts.

Less clutter. Fewer steps. Lower costs.

Cost-Effective Waste Handling

With pressurized systems and rotary airlocks, waste moves fast and clean, reducing the need for water, frequent clean-ups, or manual lifting. REYCO supplies not just the piping and blower pack, but the full component set to ensure smooth removal and downstream disposal. This makes the system economical not only to install, but to run and maintain.

More throughput. Less waste. Better ROI.
